Current Research Interests

- Carcinogenic metal ions in the transcriptional activation of signal transducing H_{α} -Ras genes through DNA minisatellites in the human genome. Interactions of heavy metal and biotoxic metal ions with DNA minisatellites and consequences in the metallobiological pathways leading to carcinogenesis. Development of biomarker technologies correlating biotoxic metal ion-DNA minisatellite interactions with diagnosis (or even prognosis) of aberrant processes in signal transduction pathways.
- Biotoxic metal ions in the pathogenesis of neurodegenerative diseases (Alzheimer, etc.) and neoplasias (carcinogenesis). Linkage of soluble inorganic complex species (environmental metallotoxins) with processes involving interactions of biotoxic metal ions with defined cellular targets, structural speciation, bioavailability and etiopathogenetic biochemical reactivity. Development of (nano)molecular sensors and

diagnostic tools for the immediate detection of early neurodegenerative events. Correlation of toxicity-neurodegeneration at the molecular level.

- Bioinorganic vanadium and zinc compounds with physiological and biomimetic substrates, as potential pharmaceuticals of anticarcinogenic and insulin mimetic activity. Synthetic, spectroscopic, magnetic, structural and biological studies of vanadium and zinc species bearing physiological and biomimetic hydroxycarboxylic acids. Controlled release of synthetic or naturally encountered molecules from (macro)molecular cages relevant to metallodrug absorption and bio-activity processes.
- Surface-modified dendrimers in the selective separation and recovery of toxic and heavy metal ions from water resources in the environment. Fundamental structure-function correlations in dendrimer physicochemical nature and reactivity supporting the development of technology management of metallotoxins in the environment.
- Development of metallofluorimetric chemosensor technology for the selective detection and quantitative determination of metallotoxins and metallotoxin pollutants in environmental and biological fluids through the use of HPLC-PCD chromatography. Monitoring applications in environmental protection and metal ionic homeostasis at the cellular level.
- Design and development of technological approaches linked to metal-catalyzed oxidative damage of biological tissues. Oxidative stress in neurodegeneration. Development of selective chemosensors of essential and non-essential metal ions in relation to clinically pathological conditions in neurodegenerative diseases.
- Synthesis of inorganic and inorganic-organic hybrid materials at low temperatures with specific chemical catalytic, physical structural and magnetic properties. Emphasis is given to the synthesis of single molecule magnets and chains as advanced materials at the nanotechnological level
- Natural antioxidants and pro-oxidant metal ionic materials in human nutrition. Mechanisms of pro-oxidant metals and antioxidant behavior of natural products through the use of experimental models in human physiology
- Design, synthesis, spectroscopic and structural characterization of biomimetic inorganic complexes as minimal representations of the active site metalloclusters in metalloenzymes. Development of catalytic processes involving small molecule activation through the employment of low molecular mass metal-ionic materials
